

Energy Efficiency, Carbon Reduction and Meeting Regulatory Obligations

With so many of our members facing pressure to reduce energy, cost and carbon emissions and meet compliance, AIMS has partnered with energy and low carbon consultancy Envantage to provide specialist knowledge and best practice specifically for the UK meat and poultry industry.

In recent survey, 69% of businesses told us they were experiencing increased energy costs and 77% said their current provider did not support them with energy saving schemes.

Envantage will support AIMS members to find out more about everything from energy and power infrastructure to optimising energy usage, reducing carbon, and meeting regulatory obligations.

The team at Envantage can also answer questions about compliance or access to energy discount schemes.

The world of energy isn't always straightforward, particularly for major users, but Envantage prides itself on being easy to work with. The firm tailors its approach around each client to deliver maximum efficiencies and cost savings, for both everyday challenges to longer-term ambitions.

Envantage can help AIMS members in four key areas:

A strategic approach to carbon and energy reduction

Helping to identify the specific changes that will help to reduce carbon, as well as how to optimise energy usage and reduce costs. This includes: Net Zero, Carbon Neutrality, Greenhouse Gas Quantification, Energy Audits, Onsite generation, ISO Energy Management Standards, Carbon Disclosure Project (CDP), Metering and Monitoring, and EnCO™ Accredited Training.

Compliance with a commercial edge

Joining the dots between what you must do from a regulatory perspective and what makes sense from a commercial perspective to deliver maximum benefits. This includes: Energy Savings Opportunity Scheme (ESOS), Streamlined Energy & Carbon Reporting (SECR), Task Force on Climate-Related Financial Disclosures (TCFD) and UK Emissions Trading Scheme (ETS)

Reducing green taxation in your energy costs

Help securing qualification for compensation schemes that can secure significant savings on your energy bills. Over and above the Climate Change Levy (CCL) reduction you may already receive, there are additional schemes helping companies save hundreds of thousands to millions of pounds each year off their

energy bills. This includes: Climate Change Agreements (CCA) and Green tax reduction (EII).

Connections, supply upgrades, metering & infrastructure

Ensure your costs do not spiral when your gas and electricity demand increases. Whether moving to different premises, installing new plant and equipment, or connecting generation equipment such as solar PV, wind turbines, biomass systems, CHP, or battery storage, we can help.

Our team ensures accredited contractors under the Gas Industry Registration Scheme (GIRS) and National Electricity Registration Scheme (NERS) work on your behalf – which offer more competitive rates and faster service delivery than the traditional gas and electricity distribution network operators.

Our experts can also help you to satisfy your regulatory obligations whilst helping to minimise supply outages on private High Voltage Networks by arranging Control Operation and Maintenance Agreements (COMAs) via our trusted network of approved HV contractors, ensuring you are compliant with the Electricity at Work Act 1989.
